

ModelAtlas

The decision layer before you spend on AI.

THEME	APPLICATION	TEAM / PROJECT
AI Marketplace	Web application	LARP / ModelAtlas

A simple way to move from an unclear AI idea to a decision a team can explain and act on.

The idea in one sentence

ModelAtlas helps a person or a business decide what AI to use, where to run it, and what it will really cost - before they buy anything.

The short version

Start with the work. Set the privacy boundary. Check the hardware. Compare the options that fit. Leave with a plan, not a shopping cart.

01 Why this is needed

Choosing AI is confusing because people are asked to choose a model and a machine before they have described the job.

Consider an Indian manufacturing company. Finance has invoices and scanned paperwork. Operations has spreadsheets and inventory information. Support has product images and internal documents. The team wants a private document assistant, but it does not know whether to use an external API, a local model, a cloud GPU, or the machines it already owns.

It needs more than a model catalogue. It needs a decision it can explain to a manager, check with its IT team, and turn into a practical plan. That is the job of ModelAtlas.

How the product works

1. Start with the work

The user explains the job in normal language. ModelAtlas turns it into a clear profile.

2. Set the boundaries

The user chooses how private the work is. Unsuitable external options are removed early.

3. Check what exists

Screenshots, invoices, or specifications help verify the hardware already available.

4. Compare what fits

The product explains capability, hosting, cost, assumptions, and risks.

5. Leave with a plan

The result can move into a team workspace and become an implementation plan.

The outcome

The product does not tell the user to buy the most expensive model. It helps them choose the simplest option that meets the workload, privacy, and budget requirements.

02 What judges can try

The seeded demo is designed to tell one complete story from a business need to a team-ready plan.

Personal Explorer

Describe a workload without needing model or infrastructure knowledge.

Privacy filter

Choose public, internal, confidential, or highly sensitive and see the effect on eligibility.

Hardware check

Review evidence and see which details are confirmed or still need a human check.

Recommendation

See one primary option, alternatives, trade-offs, risks, and verification tasks.

Research Scout

Check official, benchmark, procurement, and community information with the source and date visible.

Cost comparison

See hardware, shipping, tax, electricity, usage, and other assumptions separately.

Team workspace

Keep role details private while combining the useful context into one shared opportunity.

Implementation plan

Turn the recommendation into architecture, steps, risks, approvals, and success measures.

What makes the approach different

Most model catalogues begin with model names. ModelAtlas begins with the user's work and removes unsuitable choices before ranking the rest. It treats privacy as a boundary, keeps cost assumptions visible, and avoids presenting a confident answer when the evidence still needs checking.

Why it belongs in AI Marketplace

ModelAtlas supports discovery, evaluation, trust, cost comparison, procurement guidance, and deployment planning. It provides outbound links, but it does not pretend to be a checkout or provisioning system.

03 How AI is used responsibly

AI helps with questions, explanations, and research. The important boundaries remain visible to the user.

Prompts implemented in the application

Intake Copilot	Asks for the most important missing detail one question at a time and helps turn a plain-language description into a workload profile.
ModelAtlas Assistant	Explains recommendations clearly, follows the privacy boundary, does not invent prices or benchmarks, and warns when hardware cannot be combined safely.
Research Scout	Helps check current model, benchmark, availability, and price information and keeps the source, date, and confidence visible.

Simple rules behind the experience

Privacy comes first

Confidential work cannot quietly be sent to an unsuitable external service.

Evidence stays visible

Important claims show where they came from, when they were checked, and how confident the system is.

The assistant does not decide alone

Policy, cost, ranking, and hardware checks remain explicit instead of being hidden inside a chat response.

The demo is reliable

Seeded demo mode lets judges follow the complete journey without API keys or live scraping.

The application also supports secure authentication and private data access. It does not provision servers, process a purchase, or send confidential documents to an external provider merely to answer a question.

04 The solution and the submission

This is the short version a judge can read first, followed by the links needed to try the product.

Solution to the problem statement

ModelAtlas solves the AI Marketplace problem by helping people make a buying decision in the right order. A user starts with the work they want to improve, not with a model name. They describe the documents, images, request volume, users, budget, location, and privacy needs. ModelAtlas turns that description into a clear workload profile. It then removes options that do not meet the privacy or hardware requirements, checks the evidence for the equipment already available, and compares the remaining options on capability, hosting, cost, and setup effort. Each important claim is shown with its source and confidence. For an Indian manufacturing company, the platform also separates hardware price, shipping, tax, electricity, and usage costs instead of showing one vague number. A team can keep individual role details private, combine the useful parts into a shared opportunity, and produce an implementation plan. The built-in assistant explains the recommendation in simple language, while Research Scout helps check current facts. ModelAtlas does not pretend to be a checkout or provisioning tool; it gives the team a decision they can understand, discuss, and act on.

Judge walkthrough

- Open the landing page and start a seeded decision.
- Describe the manufacturing document workflow and confirm Confidential privacy.
- Review the Mac Studio and RTX 4090 hardware evidence.
- Choose Privacy / Local-First and compare the recommendation, costs, alternatives, and sources.
- Move the decision into the team workspace and open the implementation plan.

GitHub	Open GitHub repository
Hosted website	Open hosted website
Demo video	Video file: demo Open Google Drive folder
Team and member	LARP - Jagath Srujan

Institution and contact - University of Visvesvaraya College of Engineering | jagathsrujan@zohomail.in | +91 9483228266

Required uploads - solution document on Google Drive, GitHub repository, hosted website link, and public demo video. This is a web-only submission; no Android APK is included.
